Lasso selection

Version 1.0.0, by Giorgio Bianchini

Description: Selects tips from the tree.

Module type: Action

Module ID: `a04dcde8-75e2-43b5-a45b-e78ec8fd1ab6`

This module can be used to perform a "Lasso selection", i.e. to select nodes based on their position in the plot.

When you enable this module, a message is shown indicating that lasso selection is active. You can then use the mouse to draw a polygon on the tree plot (every time you click, a new point is added). When you reach the last vertex of the polygon, double click to close the shape. The names of the nodes that fall within the selected area are then copied to the clipboard and can be pasted into other software (e.g. a text editor).
