Apply crop

Version 1.0.0, by Giorgio Bianchini

Description: Adds a crop region including the current view or the selected node.

Module type: MenuAction

Module ID: `6856e046-3553-465a-8b35-c351428120db`

This module is used to create a new crop region based on the area that is currently visible on the plot or on the currently selected node, by enabling the *Crop region* Plot action module.

When the `Crop selection and current view` item is selected, the crop region contains the area that is currently visible in the plot and it is anchored on the currently selected node. When `Crop selection` is selected, the crop region contains the selected node and all of its descendants. When `Crop current view` is selected, the crop region contains the area that is currently visible in the plot and it is anchored on the root node of the tree.

If the button is clicked directly without choosing an item from the submenu, the action performed is either `Crop selection and current view` (if a node is currently selected) or `Crop current view` (if no node is selected).

Note: using this module without installing also the *Crop region* module (id `5a8eb0c8-7139-4583-9e9e-375749a98973`) may lead to program crashes or unexpected results.
